

# Welcome to Colab!

## Explore the Gemini API

The Gemini API gives you access to Gemini models created by Google DeepMind. Gemini models are built from the ground up to be multimodal, so you can reason seamlessly across text, images, code, and audio.

### How to get started

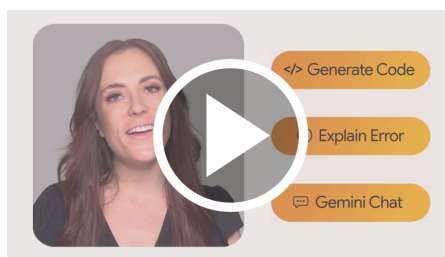

1. Go to [Google AI Studio](#) and log in with your Google account.
2. [Create an API key](#).
3. Use a quickstart for [Python](#), or call the REST API using [curl](#).

### Explore use cases

- [Create a marketing campaign](#)
- [Analyze audio recordings](#)
- [Use System instructions in chat](#)

To learn more, check out the [Gemini cookbook](#) or visit the [Gemini API documentation](#).

Colab now has AI features powered by [Gemini](#). The video below provides information on how to use these features, whether you're new to Python, or a seasoned veteran.

Start coding or [generate](#) with AI.

```
def main():
    # Input: Getting user's income
    income = float(input("Enter your total monthly income: "))

    # Input: Getting user's expenses
    num_expenses = int(input("Enter the number of expense categories: "))
    total_expenses = 0.0
    expense_categories = [] # List to hold category names
    expenses = [] # List to hold expense amounts

    # Loop to get expenses and category names
    for i in range(1, num_expenses + 1):
        category_name = input(f"Enter name for expense category {i}: ")
        expense = float(input(f"Enter expense for {category_name}: "))
        expense_categories.append(category_name) # Add category name to the list
        expenses.append(expense) # Add expense to the list
        total_expenses += expense # Add to total expenses

    # Input: Getting savings goal
    savings_goal = float(input("Enter your savings goal for the month: "))

    # Calculate remaining balance
    remaining_balance = income - total_expenses

    # Display the results
    print("\n--- Financial Summary ---")
    print(f"Total Income: ${income:.2f}")
    print(f"Total Expenses: ${total_expenses:.2f}")
    print(f"Savings Goal: ${savings_goal:.2f}")
    print(f"Remaining Balance: ${remaining_balance:.2f}")

    # Display the detailed expenses
    print("\n--- Detailed Expenses ---")
    for i in range(num_expenses):
        print(f"{expense_categories[i]}: ${expenses[i]:.2f}")

    # Check if the remaining balance meets the savings goal
    if remaining_balance >= savings_goal:
        print("Congratulations! You have enough to meet your savings goal!")
```

```

else:
    print("You need to adjust your budget to meet your savings goal.")

    # Provide recommendations
    print("\n--- Recommendations ---")

    # Calculate the shortfall
    shortfall = savings_goal - remaining_balance

    # Provide personalized recommendations
    if total_expenses > income:
        print("Consider reducing your expenses. You are spending more than your income.")
        print("Here are some areas to review:")
        print("- Discretionary spending (e.g., dining out, entertainment)")
        print("- Subscriptions (e.g., streaming services, memberships)")
        print("- Impulse purchases")

    print(f"\nTo meet your savings goal, you need to cut back by: ${shortfall:.2f}")

    # Suggestions for savings
    print("\nSuggestions to increase savings:")
    print("- Set up an automatic transfer to your savings account.")
    print("- Look for additional sources of income (e.g., freelance work, part-time jobs).")
    print("- Revisit your financial goals and adjust them if necessary.")

    # Encourage regular monitoring of finances
    print("\nRegularly monitor your expenses and savings progress to stay on track!")

if __name__ == "__main__":
    main()

```

```

↔ Enter your total monthly income: 2500
Enter the number of expense categories: 3
Enter name for expense category 1: rent
Enter expense for rent: 900
Enter name for expense category 2: groceries
Enter expense for groceries: 500
Enter name for expense category 3: dining out
Enter expense for dining out: 60
Enter your savings goal for the month: 700

--- Financial Summary ---
Total Income: $2500.00
Total Expenses: $1460.00
Savings Goal: $700.00
Remaining Balance: $1040.00

--- Detailed Expenses ---
rent: $900.00
groceries: $500.00
dining out: $60.00
Congratulations! You have enough to meet your savings goal!

```

## What is Colab?

Colab, or "Colaboratory", allows you to write and execute Python in your browser, with

- Zero configuration required
- Access to GPUs free of charge
- Easy sharing

Whether you're a **student**, a **data scientist** or an **AI researcher**, Colab can make your work easier. Watch [Introduction to Colab](#) or [Colab Features You May Have Missed](#) to learn more, or just get started below!

## ✓ Getting started

The document you are reading is not a static web page, but an interactive environment called a **Colab notebook** that lets you write and execute code.

For example, here is a **code cell** with a short Python script that computes a value, stores it in a variable, and prints the result:

```
seconds_in_a_day = 24 * 60 * 60
seconds_in_a_day
```

↗ 86400

To execute the code in the above cell, select it with a click and then either press the play button to the left of the code, or use the keyboard shortcut "Command/Ctrl+Enter". To edit the code, just click the cell and start editing.

Variables that you define in one cell can later be used in other cells:

```
seconds_in_a_week = 7 * seconds_in_a_day
seconds_in_a_week
```

↗ 604800

Colab notebooks allow you to combine **executable code** and **rich text** in a single document, along with **images**, **HTML**, **LaTeX** and more. When you create your own Colab notebooks, they are stored in your Google Drive account. You can easily share your Colab notebooks with co-workers or friends, allowing them to comment on your notebooks or even edit them. To learn more, see [Overview of Colab](#). To create a new Colab notebook you can use the File menu above, or use the following link: [create a new Colab notebook](#).

Colab notebooks are Jupyter notebooks that are hosted by Colab. To learn more about the Jupyter project, see [jupyter.org](#).

## ✓ Data science

With Colab you can harness the full power of popular Python libraries to analyze and visualize data. The code cell below uses **numpy** to generate some random data, and uses **matplotlib** to visualize it. To edit the code, just click the cell and start editing.

You can import your own data into Colab notebooks from your Google Drive account, including from spreadsheets, as well as from Github and many other sources. To learn more about importing data, and how Colab can be used for data science, see the links below under [Working with Data](#).

```
import numpy as np
import IPython.display as display
from matplotlib import pyplot as plt
import io
import base64

ys = 200 + np.random.randn(100)
x = [x for x in range(len(ys))]

fig = plt.figure(figsize=(4, 3), facecolor='w')
plt.plot(x, ys, '-')
plt.fill_between(x, ys, 195, where=(ys > 195), facecolor='g', alpha=0.6)
plt.title("Sample Visualization", fontsize=10)

data = io.BytesIO()
plt.savefig(data)
image = F"data:image/png;base64,{base64.b64encode(data.getvalue()).decode()}"
alt = "Sample Visualization"
display.display(display.Markdown(F"!!![{alt}]({image})"))
plt.close(fig)
```

↗

Colab notebooks execute code on Google's cloud servers, meaning you can leverage the power of Google hardware, including [GPUs and TPUs](#), regardless of the power of your machine. All you need is a browser.

For example, if you find yourself waiting for **pandas** code to finish running and want to go faster, you can switch to a GPU Runtime and use libraries like [RAPIDS cuDF](#) that provide zero-code-change acceleration.

To learn more about accelerating pandas on Colab, see the [10 minute guide](#) or [US stock market data analysis demo](#).

## ✓ Machine learning

With Colab you can import an image dataset, train an image classifier on it, and evaluate the model, all in just [a few lines of code](#).

Colab is used extensively in the machine learning community with applications including:

- Getting started with TensorFlow
- Developing and training neural networks
- Experimenting with TPUs
- Disseminating AI research
- Creating tutorials

To see sample Colab notebooks that demonstrate machine learning applications, see the [machine learning examples](#) below.
